

DIS 13:70 (1940)

Buzzati-Traverso, A. Some new *Drosophila* species belonging to the "obscura" group.

"obscura-group" of Europe *D.* One is the already described *D. subobscura*, which is present in Germany and Italy. To the other four species the following names have been tentatively attributed, before deciding whether one of the described species may be homologized with *D. obscura* described by Fallen in 1823: *D. obscuroides* (2 V-shaped, 3 rods and 1 dot-shaped chromosomes), *D. bilineata* (4 V-shaped and 1 dot-like chromosomes) *D. tristis* (4 V-shaped and one dot-like chromosomes) and *D. Haldanei* (chromosomes not yet analyzed).

From the study of material collected in Italy, Germany and England, it has been possible to F.P. Pomini and the writer to distinguish five different species within the

*D. subobscura*, which

is present in Germany and Italy. To the other four species the following names

have been tentatively attributed, before deciding whether one of the described

species may be homologized with *D. obscura* described by Fallen in 1823: *D.*

*obscuroides* (2 V-shaped, 3 rods and 1 dot-shaped chromosomes), *D. bilineata* (4 V-

shaped and 1 dot-like chromosomes) *D. tristis* (4 V-shaped and one dot-like chromo-

somes) and *D. Haldanei* (chromosomes not yet analyzed).
