

Zhang + Liang (1993)

# 果蝇亚属一新种

(双翅目:果蝇科)

张文霞 梁醒财

(中国科学院昆明动物研究所, 昆明 650107)

整理鉴定武陵山生物资源考察所采果蝇科标本, 发现果蝇亚属 (*Drosophila*) 一新种。现记述如下。模式标本保存于中国科学院昆明动物研究所。

**棒果蝇 *Drosophila (Drosophila) fustiformis* 新种(图 1—3)**

♂: 体长约 3.5mm, 翅长约 3.0mm。

头部: 复眼红色, 被微毛。触角第二节黄色, 具 2 根长刚毛; 第三节亦黄色; 触角芒分枝毛背侧 5, 腹侧 2, 端叉大。下颚须黄色, 顶端及外侧亚中部具 2 根长刚毛。腹外侧散生几根小刚毛。单眼三角区及眶区黄色, 额棕黄色, 单眼内侧棕色。单眼鬃长, 外伸, 具几对小刚毛。额从侧面观银白色, 具额毛。额为头宽的 1/2。颜浅黄色, 鼻瘤下部高。口上片棕色。颊黄色, 高为复眼最大直径的 1/6。orb<sub>2</sub> 与 orb<sub>1</sub> 相比稍近内顶鬃。orb<sub>2</sub> 位于 orb<sub>1</sub> 与 orb<sub>3</sub> 的中央。orb<sub>2</sub>/orb<sub>1</sub> = 1/4, orb<sub>3</sub>/orb<sub>1</sub> = 5/6。髭粗长, or<sub>2</sub>/or<sub>1</sub> = 3/4。

胸部: 背板、侧板及小盾片黄色。肩鬃 2, 几乎等长。ac8 列。前背中鬃/后背中鬃 = 0.6。前背中鬃与后背中鬃间的距离为两前背中鬃间距离的 1/2。小盾片前鬃平行或外伸, 后鬃内伸且交叉。SI = 0.47, 腹侧板中鬃亦长。

足: 黄色。前足股节内侧具约 10 黑棘齿。♂前足基跗节及第二分跗节粗, 内侧具密集的黄色绒毛, 其余各分跗节细。中足具端鬃, 前、中、后 3 对足均具亚端鬃。中、后足基跗节长为其余各分跗节长之和。

翅: 透明, 后横脉云状。C<sub>1</sub>—鬃 2 根, 上面一根更长。R<sub>4+5</sub>, 与 M<sub>1</sub> 平行。C = 3.5, 4C = 0.6, 4V = 1.27, 5X = 1.0, Ac = 2.0, C3F = 2/5—1/2。平衡棒浅黄白色。

腹部: 黄色, 背板各节具中间断开且不达侧缘的后缘棕色横带。

围阳体(图 1): 生殖弓下端斜截形, 具 2 根短鬃毛。被微毛。上端具约 3 根长鬃, 下端具约 5 根长鬃。肛板亦被微毛及鬃, 肛腹端具小簇毛。抱器长, 齿短, 约由 7 齿组成齿列。

阳体(图 2,3): 阳茎黄色, 顶端似喇叭状, 后侧面具一对骨化强的长细突, 亚端至亚基具一窄条骨化强的区域。后阳基侧突(?)透明, 圆棒状, 被微毛。具生殖腹板突及一对亚中刺。前阳基侧突与生殖腹板融合, 具 2 感觉毛。

正模♂, 湖南省桑植县天平山, 海拔 1400m, 1988. VII. 22。梁醒财采。副模 2♂♂, 同上。

鉴别特征：该种属伊米果蝇 *immigrans* 种组，伊米果蝇亚种组，与拟红缝果蝇 *Drosophila (Drosophila) ruberrimoides* Zhang et Gan 有类似的后阳基侧突(?)的结构。但阳茎端叉似缅甸果蝇 *Drosophila (Drosophila) burmae* Toda 呈喇叭状。

## A NEW SPECIES OF *DROSOPHILA* (DIPTERA: DROSOPHILIDAE)

ZHANG WEN-XIA LIANG XING-CAI

(Kunming Institute of Zoology, Academia Sinica, Kunming 650107)

The present paper describes a new species, *Drosophila (Drosophila) fusiiformis* Zhang et Liang, which belongs to *immigrans* species-subgroup. It is allied to *Drosophila (Drosophila) ruberrimoides* Zhang et Gan, especially in having similar structure of gonopod (?). Aedeagus distally trumpet-like resembled *Drosophila (Drosophila) burmae* Toda. But it differs from them in the pattern of ♂ terminalia (figs. 1—3) in detail. Epandrium pubescent, with ca. 3 setae in upper part, ca. 5 in lower part, ventral margin truncate, with ca. 2 small setae. Cercus oval, pubescent and setigerous, with tuft of short stout setae at caudoventral corner. Surstylus slender, with ca. 7 primary presisetae in nearly straight row on submedia to upper distal margin. Caudoventrally with several small setae. Aedeagus yellow, distally expanded like trumpet, dorsolaterally with 1 pair of slender, acute, sclerotized projections, laterally with long sclerotized area from submedial to subapical part. Gonopod (?) transparent, club-shaped with small hairs. Hypandrium with a pair of paramedian spines, hypandrial process elongate, apically somewhat pointed. Parameres fused to hypandrium, with ca. 2 sensilla.

Holotype ♂, Tian Ping Mountain, Sangzhi County, Hunnan Province, 1400 m, July 22, 1988. Collected by Liang X. C.. Paratypes: 2♂♂, ditto.

All the types are deposited in Kunming Institute of Zoology, Academia Sinica.
